PCRecruiter is a web-based system, but does require some basics on your own computer. If you have not already done so, you'll need to install these three items:

1. **A current web browser.** PCRecruiter is tested for Google Chrome, but also works in Microsoft Edge and Safari.
2. **The Java Runtime Engine**, which allows the PCR Launcher to communicate between the browser and other system software. Windows users can use either of the downloads below. Mac users should choose the Amazon link.
   - Amazon Corretto JRE Download (Mac/Windows)
     - Windows users should download the Windows x64 JDK or x32 JDK file from this page, depending on their Windows version. You can check whether you are on a 64-bit or 32-bit computer under Settings > System > About. Look at the "System type" under Device specifications.
   - Oracle JRE Download (Oracle Java for Windows)
3. **The PCRecruiter Launcher**. This is a small application for Windows (also available as a .zip) or Mac that bridges the gap between the web-based PCRecruiter and your desktop system for things like editing resumes and popping up alarms.
   - Windows: exe / zip
   - Mac: dmg

The PCRecruiter Launcher will automatically prompt you whenever a new update is available. Choose "Allow" on these updates as they appear.
